

SCOPE OF AGRÉMENT

This Agrément relates to Heatlok HFO Pro (hereinafter the 'Product'), an in-situ formed, HFO-blown, spray-applied (hereinafter 'applied') thermal insulation layer which contributes to the thermal performance, airtightness, vapour-tightness and watertightness of external walls in new and existing domestic buildings. The Product is for internal application on the inside face of solid masonry walls (where masonry includes clay and calcium silicate bricks, concrete blocks, and natural and reconstituted stone block), between the studs of sheathed timber or steel-framed walls with outer masonry leaf.

DESCRIPTION

The Product consists of two liquid components (hereinafter 'Product components') that are mixed under pressure and applied in-situ to form a closed cell structure, rigid polyurethane (PUR) seamless foam insulation layer, in accordance with BS EN 14315-2, that adheres to the treated surface. It is produced by an exothermic reaction between the isocyanate component and the resin (polyol blend) component. The Product is applied in layers until the final required design thickness (not exceeding 300 mm) is achieved. Once applied, the Product expands, solidifies and cures.

ILLUSTRATION

THIRD-PARTY ACCEPTANCE

See Section 3.3 (Third-Party Acceptance).

STATEMENT

It is the opinion of Kiwa Ltd. that the Product is safe and fit for its intended use, provided it is specified, installed and used in accordance with this Agrément.

Craig Devine
Operations Manager, Building Products

Alpheo Mlotha CEng FIMMM MBA
Business Unit Manager, Building Products

SUMMARY OF AGRÉMENT

This document provides independent information to specifiers, building control personnel, contractors, installers and other construction industry professionals considering the safety of and fitness for the intended use of the Product. This Agrément covers the following:

- Conditions of use;
- Production Control, Quality Management System and the Annual Verification Procedure;
- Product components and ancillary items, points of attention for the Specifier and examples of details;
- Installation;
- Independently assessed Product characteristics and other information;
- Compliance with national Building Regulations, other regulatory requirements and Third-Party Acceptance, as appropriate;
- Sources.

MAJOR POINTS OF ASSESSMENT

Moisture control - the Product (see Section 2.2.9):

- has a high-volume closed cell percentage;
- can contribute to limiting the risk of interstitial and surface condensation;
- is resistant to water vapour and water penetration.

Fire performance - the Product is classified as European Classification E, in accordance with BS EN 13501-1 (see Section 2.2.10).

Thermal performance - the Product improves the thermal insulation of external walls and can contribute to satisfying the requirements of the national Building Regulations (see Section 2.2.11).

Durability - the Product shall have a service life durability equivalent to that of the building into which it is incorporated (see Section 2.2.12).

UKCA and CE marking - the Agrément holder has responsibility for conformity marking, in accordance with all relevant British and European Product Standards (see Section 2.2.13).

CONTENTS

Chapter 1 - General considerations

- 1.1 - Conditions of use
- 1.2 - Production Control and Quality Management System
- 1.3 - Annual Verification Procedure - continuous surveillance

Chapter 2 - Technical assessment

- 2.1 - Ancillary items
- 2.2 - Points of attention to the Specifier
- 2.3 - Examples of typical details
- 2.4 - Installation
- 2.5 - Independently assessed Product characteristics

Chapter 3 - CDM, national Building Regulations and Third-Party Acceptance

- 3.1 - The Construction (Design and Management) Regulations 2015 and The Construction (Design and Management) Regulations (Northern Ireland) 2016
- 3.2 - The national Building Regulations
- 3.3 - Third-Party Acceptance

Chapter 4 - Sources

Chapter 5 - Amendment history

Chapter 6 - Conditions of use

1 GENERAL CONSIDERATIONS

1.1 CONDITIONS OF USE

1.1.1 Design considerations

See Section 2.2.

1.1.2 Application

The assessment of the Product relates to its use in accordance with this Agrément and the Agrément holder's requirements.

1.1.3 Assessment

Kiwa Ltd. has assessed the Product in combination with relevant test reports, technical literature, the Agrément holder's quality plan, DoPs and site visit, as appropriate.

1.1.4 Installation supervision

The quality of installation and workmanship must be controlled by a competent person who must be an employee of an Approved Installer.

The Product shall be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

1.1.5 Geographical scope

The validity of this document is limited to England, Wales, Scotland, Northern Ireland and Ireland, with due regard to Chapter 3 of this Agrément (CDM, national Building Regulations and Third-Party Acceptance).

1.1.6 Validity

The purpose of this BDA Agrément® is to provide for well-founded confidence to apply the Product within the scope described. The validity of this Agrément is three years after the issue date, and as published on www.kiwa.co.uk/bda.

1.2 PRODUCTION CONTROL AND QUALITY MANAGEMENT SYSTEM

Kiwa Ltd. has determined that the Agrément holder fulfils all their obligations in relation to this Agrément, in respect of the Product.

The initial audit demonstrated that the Agrément holder has a satisfactory Quality Management System (QMS) and is committed to continuously improving its quality plan. Document control and record-keeping procedures were deemed satisfactory. A detailed Production Quality Specification (PQS) has been compiled to ensure traceability and compliance under the terms of this Agrément.

1.3 ANNUAL VERIFICATION PROCEDURE - CONTINUOUS SURVEILLANCE

To demonstrate that the Product conforms with the requirements of the technical specification described in this Agrément, an Annual Verification Procedure has been agreed with the Agrément holder in respect of continuous surveillance and assessment, and auditing of the Agrément holder's QMS.

2 TECHNICAL ASSESSMENT

This Agrément does not constitute a design guide for the Product. It is intended as an assessment of safety and fitness for purpose only.

2.1 ANCILLARY ITEMS

The following ancillary items detailed in this Section may be used in conjunction with the Product, but fall outside the scope of this Agrément:

- spray machinery, including plural component proportioner (double-acting positive displacement piston metering pumps) fitted with spray gun application equipment;
- Type LR breather membrane;
- vapour control layer (hereinafter 'VCL');
- plasterboard lining.

2.2 POINTS OF ATTENTION TO THE SPECIFIER

2.2.1 Design responsibility

A Specifier may undertake a project-specific design, in which case it is recommended that the Specifier co-operates closely with the Agrément holder. The Specifier or installing contractor is responsible for the final as-built design.

2.2.2 Applied building physics (heat, air, moisture)

A competent specialist shall check the hygrothermal behaviour of a project-specific design incorporating the Product, and if necessary, offer advice in respect of improvements to achieve the final specification. The specialist can be either a qualified employee of the Agrément holder or a suitably qualified consultant (in which case it is recommended that the consultant specialist co-operates closely with the Agrément holder).

2.2.3 General design considerations

The Product can:

- insulate surfaces in restricted or curved areas which are typically hard to treat;
- upgrade walls with existing insulation between studs to meet current thermal transmittance (hereinafter 'U-value') requirements;
- be left exposed in non-habitable room spaces or be covered with plasterboard lining in habitable rooms where there is adequate ventilation;
- reduce the U-value of walls of new domestic buildings.

A project-specific design shall also give due consideration to:

- BS 8000-0;
- BS 8103-3;
- BS EN 300;
- BS EN 351-1;
- BS EN 1992-1-1;
- BS EN 1993-1-1;
- BS EN 1995-1-1;
- BS EN 1996-1-1;
- BS EN 12467.

Sheathed timber or steel-framed walls shall:

- include a minimum nominal cavity of 50 mm width between the outer masonry leaf and the Product;
- incorporate cavity barriers at edges, around openings, penetrations, at junctions with roof or floor cavities and in extensive cavities with fire-resisting elements in accordance with the relevant provisions of the national Building Regulations.

Ventilation openings shall be arranged to prevent the ingress of rain, snow, birds and small animals, and reduce the risk of blockage by other building operations.

To prevent water ingress, due consideration shall be given to the design of joint detailing at window/door openings and flue pipe penetrations in accordance with BS 6093.

The Product shall not be applied over junctions between roofs, floors and compartment walls or external walls that are required to provide a minimum period of fire resistance. Care shall be taken to ensure continuity of fire resistance at junctions with fire-resisting elements, in accordance with the national Building Regulations.

In habitable room spaces, the Product shall be covered by a plasterboard lining fixed to studs or battens and with all joints taped, sealed and supported by studs, noggins or battens to give a minimum 30-minute fire rating.

For non-residential buildings in England, Wales and Northern Ireland, the Product may be used in walls above 11 m where the building has been assessed as suitable by the Agrément holder. However, height restrictions apply of up to 18 m for fire performance purposes in accordance with the requirements of national Building Regulations (see Section 2.2.10).

The Product forms a strong bond with clean, dry substrates. This shall be considered when specifying the Product or anticipating future alterations.

A suitable breather membrane incorporating lapped and sealed joints shall be applied on the cavity face of the timber sheathing board to protect the sheathing and timber-framed wall from moisture and allow water vapour from within the frame to pass into the cavity.

The Product shall not be applied over electrical cables, recessed lighting or existing ventilation gaps. Consider re-routing, re-laying in conduit or trunking, or de-rating electrical cables. Replace existing recessed lighting with ventilated fittings that incorporate a protective fire hood.

The Product is a closed cell foam which is inert once cured and is therefore chemically inactive. The Product will not react with metals typically used in construction elements.

New build design considerations

New walls shall be designed and constructed in accordance with the relevant standards and national Building Regulations, for the site exposure zone and wind-driven rain index in accordance with BS 8104, to prevent moisture ingress and air infiltration. Where required, due consideration shall be given to relevant third-party requirements. Installation of the Product shall not be undertaken until the wall is weathertight, i.e. the roof is in place and the window and door openings are sealed.

Retrofit design considerations

Existing walls shall be in a good state of repair with no signs of rain penetration or damp. Any necessary repairs shall be carried out prior to installation.

2.2.4 Project-specific design considerations

The project-specific design shall take into account the service life durability required - see Section 2.2.12.

The project-specific design shall take into account the requirements of the national Building Regulations - see Section 3.2.

A pre-installation survey is required to allow determination of the project-specific design - see Section 2.4.

2.2.5 Permitted applications

Only applications designed according to the specifications given in this Agrément are permitted. In each case, the Specifier and Installer shall co-operate closely with the Agrément holder.

2.2.6 Installer competence level

The Product shall be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

Installation shall be by employees trained and approved by the Agrément holder.

2.2.7 Delivery, storage and site handling

The Product components are delivered to site in suitable packaging bearing the Product name, the Agrément holder's name and the BDA Agrément® logo incorporating the number of this Agrément.

Prior to installation, store the Product components in accordance with the Agrément holder's requirements. When required, particular care shall be taken to:

- avoid exposure to direct sunlight for extended periods of time;
- avoid exposure to high or low temperatures for extended periods of time;
- store in a well-ventilated covered area to protect components from rain, frost and humidity.
- store away from possible ignition sources.

The Product components, packaged in drums, are sensitive to humidity and shall be stored in sealed drums or hermetically sealed tanks to protect them from moisture. Drums shall be stored indoors at temperatures between:

- 15 °C and 30 °C for the isocyanate component;
- 15 °C and 25 °C for the resin component.

The isocyanate component is classified as 'harmful' under The Chemicals (Hazard Information and Packaging for Supply) Regulations 2009 (CHIP 4); drums containing Product components bear the appropriate hazard warning signs. Ventilate the treated area for 24 hours after application to prevent the inhalation of isocyanate vapour. When cured, the Product is non-hazardous.

2.2.8 Maintenance and repair

Once installed, the Product does not require regular maintenance, provided the weathertightness of the wall is maintained. Damaged or poorly applied Product shall be removed from the affected area using a handsaw. New Product shall then be applied. For advice in respect of repair, consult the Agrément holder.

Performance factors in relation to the Major Points of Assessment

2.2.9 Moisture control

Cell structure

The Product has a high-volume closed cell percentage (94.6 %), in accordance with BS EN ISO 4590.

Water vapour transmission

The performance of the Product in relation to water vapour permeability is in accordance with BS EN 12086, Method A and is detailed in Section 2.5.1.

Condensation risk

Walls incorporating the Product can adequately limit the risk of interstitial and surface condensation when designed in accordance with BS 5250 and BRE Report 262. Room spaces shall be ventilated in accordance with BS 5250. Care shall be taken to provide adequate trickle ventilation, particularly in rooms expected to experience high humidity, and to ensure the integrity of any VCL (where installed) and plasterboard lining against vapour ingress.

On new buildings where third-party requirements apply, a VCL may be required, as defined in BS 5250.

When required by the project-specific design, a Condensation Risk Analysis (CRA) or hygrothermal analysis shall be carried out by the Agrément holder, in accordance with BS EN ISO 13788 or BS EN 15026 respectively.

Where indicated (by assessment to BS 5250) a suitable VCL incorporating lapped and sealed joints shall be applied behind the dry lining in rooms, to restrict the passage of water vapour from within the building to the wall. The effect of exposure location and building orientation on the performance of a VCL can be assessed by using the methodology specified in BS EN 15026.

Water permeability

The closed cell structure means the Product is water resistant but cannot be classified as waterproof.

2.2.10 Fire performance

The Product is classified as European Classification E (combustible), in accordance with BS EN 13501-1.

For non-residential buildings in England, Wales and Northern Ireland, the following applies in accordance with the national Building Regulations:

- the Product shall not be used on buildings with a storey of 18 m or more above ground level. Refer to the relevant national Building Regulations for types of buildings and any exclusions that may apply;
- boundary restrictions will apply dependent on the outermost surface materials of the external wall incorporating the Product, facing the boundary.

For residential buildings in England, Wales and Northern Ireland, the following applies in accordance with the national Building Regulations:

- the Product is restricted to buildings with no floor more than 11 m above ground level. Refer to the national Building Regulations for types of buildings and any exclusions that may apply;
- boundary restrictions will apply dependent on the outermost surface materials of the external wall incorporating the Product, facing the boundary.

For all buildings in Scotland, the Product is not classified as non-combustible and is restricted to buildings with no floor more than 11 m above ground level and not less than 1 m from the boundary. In such cases, the Product may be excluded from the unprotected area calculation regardless of openings. Refer to the national Building Regulations for types of buildings and any exclusions that may apply.

In habitable room spaces, the Product shall be covered by a plasterboard lining fixed to studs or battens and with all joints taped, sealed and supported by studs, noggins or battens, to give a minimum 30-minute fire rating.

In all constructions, cavity barriers shall be provided to comply with the relevant provisions of the national Building Regulations.

For guidance and detailed conditions of use regarding supporting wall fire performance, cavity closers and barriers, fire stopping of service penetrations and combustibility limitations for other materials and components used in the overall wall construction, designers shall refer to the relevant national Building Regulations.

The Product shall be:

- protected from naked flames and other ignition sources during and after application;
- applied at least 75 mm from recessed lighting and shall not be applied inside electric outlets or junction boxes.

Proximity of flues and appliances

Non-combustible insulation shall separate or shield the installed Product from any heat-emitting devices, fixed combustion appliances, incinerators, recessed lighting, fireplaces, chimneys or flue pipes passing through external walls, and from any potential source of ignition where the temperature is in excess of 93 °C, in accordance with the provisions of the national Building Regulations.

2.2.11 Thermal performance

Thermal conductivity

The Product offers high thermal resistance relative to its installed thickness, in accordance with BS EN 12667.

For the purpose of U-value calculations, and to determine if the requirements of the national Building Regulations are met, the thermal resistance and U-value of walls incorporating the Product shall be calculated according to BS EN ISO 10211 (taking into consideration BS EN ISO 6946, BS EN ISO 10456 and BRE Report 443), using the Product's declared thermal conductivity (λ_D). Design and declared thermal values can be found in BS EN ISO 10456.

The Product can be used to upgrade walls that have existing insulation between the studs, to meet current U-value requirements.

Account shall be taken of standardised junction details in the Government Accredited Construction Details for Part L, England and Wales, Accredited Construction Details for Scotland, and energy efficiency measures in PAS 2030 and PAS 2035.

The requirement for limiting heat loss through the building fabric, including the effect of thermal bridging, can be satisfied if the U-value of a wall incorporating an appropriate thickness of the Product does not exceed the maximum U-values given in the national Building Regulations.

The maximum thickness of the Product shall not exceed 300 mm.

Thermal bridging at junctions and around openings

The applied Product forms a solid and seamless airtight insulating foam layer without joints or gaps, reducing thermal bridges.

Care shall be taken in the overall design and construction to minimise air infiltration and thermal bridging at junctions with other elements.

Guidance on linear thermal transmittance, heat flows and surface temperature factors can be found in the documents supporting the national Building Regulations and BS EN ISO 10211, BRE Information Paper 1/06, BRE Report 262, BRE Report 497 and PAS 2030.

2.2.12 Durability

The Product shall have a service life durability equivalent to that of the building into which it is incorporated.

2.2.13 UKCA and CE marking

The European standard for the Product is BS EN 14315-1.

2.3 EXAMPLES OF TYPICAL DETAILS

Diagram 1 - Typical detail timber-framed wall with outer blockwork

Diagram 2 - Typical detail solid masonry wall

2.4 INSTALLATION

The Product shall be installed strictly in accordance with the instructions (hereinafter 'Installation Manual') of the Agrément holder, the requirements of this Agrément and the requirements of BS 8000-0.

2.4.1 Installer competence level

See Section 2.2.6.

2.4.2 Delivery, storage and site handling

See Section 2.2.7.

2.4.3 Project-specific installation considerations

The project-specific design shall be determined from a pre-installation survey.

The primary requirement of the pre-installation survey is to determine the following:

- the moisture content of the substrate surface is less than 19 % before application of the Product;
- the substrate and ambient temperature are a minimum of -5 °C. An infrared or contact thermometer can be used for checking substrate surface temperature;
- all wall elements are weathertight, the roof is in place and the window and door openings are sealed before the application of the Product;
- there is no existing rain ingress, dampness, staining or condensation on the internal face of timber sheathing;
- the existing wall is structurally sound;
- the type, suitability and condition of steel and timber studs and any openings;
- the type, suitability and condition of sheathing boards and any breather membrane present;
- stud void ventilation requirements and room space ventilation requirements;
- areas not to be treated.

2.4.4 Preparation

The following considerations apply before starting the work:

- application of the Product shall be carried out in accordance with BS 8000-0, BS EN 14315-1 and BS EN 14315-2;
- application of the Product may produce a build-up of harmful vapours. Installers shall wear personal protective equipment (PPE) when working with the Product, including nitrile gloves, disposable overalls and a full-face supplied-air respirator (SAR);
- some vapours given off by Product components are heavier than air and will naturally move to lower parts of the building compartment. These areas shall be suitably ventilated. Warning signs shall be posted to advise other trades and personnel to avoid entering the work area during and immediately after application. If vapour levels need to be measured, methods shall be in accordance with those recommended by the Health and Safety Executive. In certain conditions (e.g. application in a confined space), the use of extractor fans is recommended. Ensure proper ventilation in the work area;
- the relative humidity of the air in the workplace shall be less than 80 % to minimise the risk of surface condensation. Care shall be taken to ensure that ingress of moisture vapour from other areas of the dwelling space is restricted;
- other trades and personnel shall maintain a distance of 8 m from Installers during application of the Product;
- during application, prohibit contact with open flames and sources of ignition;
- the spraying machine shall be specially designed to spray the Product via a spray gun. The Product is applied with volumetric displacement pumps with fixed mixing ratio A/B = 1/1 by volume. The ratio will be controlled prior to each application by measuring the flow rates of the two components before they pass through the spraying machine;
- the spraying machine shall have a temperature controller in its pre-heaters and hoses. The initial primary heater and hose-heat set-point temperature shall be between 41 °C and 46 °C;
- the initial processing set-point pressure of the spray machine shall be between 1200-1400 psi or 85-95 bar;
- application of the Product shall be limited to a maximum thickness of 50 mm per pass;
- the Product shall be protected if hot work is to take place nearby, e.g. by using heat blankets;
- application shall be avoided during excessively windy conditions;
- the maximum thickness of the Product shall not exceed 300 mm.

The following works shall be undertaken before the installation of the Product:

- substrate preparation and application parameters of the spraying equipment in accordance with Product application guide;
- any timber treatment;
- water pipes and other plumbing shall be positioned towards the interior of insulated assemblies to avoid risk of freezing;
- air vents shall be closed or sleeved to prevent blockage by the Product;
- services, e.g. electrical cables, may need re-routing or trunking;
- any necessary repairs completed, such as replacing damp or damaged window or door frame timbers;
- any necessary welding of metal elements;
- walls made weathertight;
- flues isolated by applying non-combustible thermal insulation material around them;
- front faces of surfaces not to be treated covered, e.g. exposed studs;
- services covered, e.g. electrical cables and pipes etc.;
- access to services, task lighting, safety and breathing equipment, and ventilation facility (if required) in the compartment treated prior to application.

2.4.5 Outline installation procedure

The detailed installation sequence can be found in full in the Agrément holder's Installation Manual.

The key sequence for installation is:

General

- set the appropriate temperature and pressure parameters to guarantee the mixing quality of the Product and select a suitable spraying nozzle;
- carry out quality control tests to check for a round spray pattern, sticky patches, light or dark patches/streaks, no voids, consistent colour, correct appearance, reaction profile (cream time, gel time, tack-free time and free-rise density), using test methods in accordance with BS EN 14315-1;
- check interlaminar adhesion on a two-layer spray sample;
- apply with the spray gun at a 90 ° angle to the substrate and hold the gun 45-60 cm away from the substrate;
- apply the Product vertically or horizontally to the substrate while overlapping the passes 60-80 %;
- limit the application of the Product to no more than 15 mm thick for the first layer (flash coat layer) then 50 mm per pass;
- apply a second layer immediately after the first one has fully risen;
- if subsequent passes are required, wait until the temperature of the foam surface has dropped below 30 °C to allow any reaction heat to dissipate from the prior applications before attempting to apply additional layers of the Product.

Sheathed timber or steel-framed walls

- apply the Product between studs directly onto the inside of oriented strand board (hereinafter 'OSB') or plywood sheathing board;
- apply the Product to the back face of each stud bay and along the sides of the stud so the Product will adhere to all surfaces within the bay;
- for walls that have either polyisocyanurate (PIR) or expanded polystyrene (EPS) insulation board between the studs, the Product can be applied onto the inside of the insulation board;
- for a greater thickness, apply the Product to the depth of the studs. Cross-battens are then mechanically fixed to the studs. The battens shall be of sufficient width and spacing (up to 600 mm) to provide adequate support to which the wall lining board can be mechanically fixed. Resume filling in layers with a maximum thickness of 50 mm.

Solid masonry walls

- when applying the Product to substrates without studwork elements, avoid applying in passes wider than 600 mm;
- initially, create substitute studwork at 600 mm centres with vertical passes of the Product; then fill the artificially created bays in between to the required depth. Apply the Product in passes to achieve the required depth of foam;
- alternatively, the Product can be applied to dry masonry surfaces between timber/metal studs fitted at 600 mm centres, standing off the wall by at least 25 mm to reduce thermal bridging through the studs;
- fit vertical studs with additional battens around openings and to support heavy horizontal items;
- apply the Product to a wall and between the studs to the required depth and to window reveals, to avoid thermal bridging;
- when fitting the internal lining, a service void can be left between the Product and the internal plasterboard lining.

2.4.6 Finishing

The following finishing is required on completion of the installation:

- the Product shall be cured and cold prior to undertaking any finishing work;
- any excess Product can be trimmed flat using a handsaw and covered with a plasterboard lining or other internal board and VCL as required;
- follow the post-application best practices according to 'Guidance on best practices for installation of spray polyurethane foam'.

2.5 INDEPENDENTLY ASSESSED PRODUCT CHARACTERISTICS

2.5.1 Moisture control

Test		Standard	Result
Cell structure	Open and closed cell volume	BS EN ISO 4590 Method 2a	94.6 % closed cells
Water vapour transmission	Water vapour permeability (δ)	BS EN 12086 Method A	0.015 mg/(mhPa)
	Water vapour diffusion factor (μ)		47
	Water vapour diffusion equivalent air layer thickness (S_d)		0.96 m
Water absorption	Short-term water absorption	BS EN 1609 Method B	surface without skin 0.157 kg/m ²
			surface with skin 0.147 kg/m ²

2.5.2 Fire performance

Test	Standard	Result
Reaction to fire	BS EN 13501-1	E

2.5.3 Thermal performance

Test	Standard	Result
Declared aged thermal conductivity (λ_D)	20-200 mm thick BS EN 12667	0.025 W/mK

2.5.4 Other properties

Test	Standard	Result (mean)
Dimensional stability under specified conditions (70 °C, 90 % RH)	BS EN 1604	Δl 2.4 %
		Δw 1.5 %
		Δt 0.9 %
Adhesion strength perpendicular to faces	BS EN 1607	on OSB 137.3 kN/m ²
		on fibre cement boards 50.2 kN/m ²
		steel board (foil faced) 86.7 kN/m ²
		concrete 94.7 kN/m ²
		render-board 88.1 kN/m ²
Compressive strength @ 10 % strain	BS EN 826	166.65 kN/m ²
Core free-rise density	BS EN 14315-1	28.8 kg/m ³

REACH Statement for the Product in respect of emission of dangerous substances in accordance with Regulation (EC) No 1907/2006 confirms that no hazardous materials are present.

3.1 THE CONSTRUCTION (DESIGN AND MANAGEMENT) REGULATIONS 2015 AND THE CONSTRUCTION (DESIGN AND MANAGEMENT) REGULATIONS (NORTHERN IRELAND) 2016

Information in this Agrément may assist the client, principal designer/CDM co-ordinator, designer and contractors to address their obligations under these Regulations.

3.2 THE NATIONAL BUILDING REGULATIONS

In the opinion of Kiwa Ltd., the Product, if installed and used in accordance with Chapter 2 of this Agrément, can satisfy or contribute to satisfying the relevant requirements of the following national Building Regulations.

This Agrément shall not be construed to confer the compliance of any project-specific design with the national Building Regulations.

3.2.1 England

The Building Regulations 2010 And Subsequent Amendments

- C2(c) Resistance to moisture - a wall incorporating the Product can adequately protect a building from interstitial and surface condensation
- L1(a)(i) Conservation of fuel and power - the Product can limit heat gains and losses through a wall
- Regulation 7(1) Materials and workmanship - the Product is manufactured from suitably safe and durable materials for its application and can be installed to give a satisfactory performance
- Regulation 23(1) Requirements relating to thermal elements - the Product can contribute to a wall complying with the requirements of L1(a)(i)
- Regulation 26 CO₂ emission rates for new buildings - the Product can contribute to a building not exceeding its target CO₂ emission rate
- Regulation 26A Fabric energy efficiency rates (new buildings) - the Product can contribute to satisfying this Regulation
- Regulation 26C Target primary energy rates for new buildings - the System can contribute to satisfying this Requirement

3.2.2 Wales

The Building Regulations 2010 And Subsequent Amendments

- C2(c) Resistance to moisture - a wall incorporating the Product can adequately protect a building from interstitial and surface condensation
- L1(a)(i) Conservation of fuel and power - the Product can limit heat gains and losses through a wall
- Regulation 7(1) Materials and workmanship - the Product is manufactured from suitably safe and durable materials for its application and can be installed to give a satisfactory performance
- Regulation 23(1) Requirements relating to thermal elements - the Product can contribute to a wall complying with the requirements of L1(a)(i)
- Regulation 26 CO₂ emission rates for new buildings - the Product can contribute to a building not exceeding its target CO₂ emission rate
- Regulation 26A Primary energy consumption rates for new buildings - the Product can contribute to satisfying this Regulation
- Regulation 26B Fabric performance values for new dwellings - the Product can contribute to satisfying this Regulation
- Regulation 26C Minimum energy efficiency rating - the System can contribute to satisfying this Requirement

3.2.3 Scotland

The Building (Scotland) Regulations 2004 And Subsequent Amendments

3.2.3.1 Regulation 8(1) Durability, workmanship and fitness of materials

- The Product is manufactured from acceptable materials and is adequately resistant to deterioration and wear under normal service conditions, provided it is installed in accordance with the requirements of this Agrément

3.2.3.2 Regulation 9 Building standards - construction

- 3.15 Condensation - a wall incorporating the Product can protect a building from moisture caused by surface or interstitial condensation
- 6.2 Building insulation envelope - the Product will contribute to the insulation envelope to resist thermal transfer
- 7.1(a)(b) Statement of sustainability - the Product can contribute to satisfying the relevant Requirements of Regulation 9, Sections 1 to 6, and therefore will contribute to a construction meeting a bronze level of sustainability, as defined in this Standard; in addition, the Product can contribute to a construction meeting a higher level of sustainability, as defined in this Standard

3.2.3.3 Regulation 12 Building standards - conversions

- All comments given under Regulation 9 also apply to this Regulation, with reference to Schedule 6 of The Building (Scotland) Regulations 2004 and subsequent amendments, clause 0.12 of the Technical Handbook (Domestic)

3.2.4 Northern Ireland

The Building Regulations (Northern Ireland) 2012 And Subsequent Amendments

- 23(1)(a)(b) Fitness of materials and workmanship - the Product is suitable and can be adequately mixed, prepared and applied
- 29 Condensation - walls incorporating the Product can adequately protect a building from moisture in the form of interstitial condensation
- 39(a)(i) Conservation measures - the Product will limit heat gains and losses through a wall
- 40(2) Target carbon dioxide emission rate - the Product will contribute to a building to not exceed its target CO₂ emission rate

3.2.5 Ireland

Building Regulations 1997 And Subsequent Amendments

In order to demonstrate compliance with Irish Building Regulations, this BDA Agrément® certifies that the Product complies with the requirements of a recognised document and indicates it is suitable for its intended purpose and use.

- C4 Resistance to weather and ground moisture - walls in which the Product is incorporated can enable a building to prevent the passage of moisture to the inside of the building
- D1 Materials and workmanship - the Product is manufactured from suitably safe and durable materials for the application and can be installed to give a satisfactory performance
- L1 Conservation of fuel and energy - the Product can enable a building to conserve energy and limit CO₂ emissions

3.3 THIRD-PARTY ACCEPTANCE

In the opinion of Kiwa Ltd. if installed, used, and maintained in accordance with this Agrément, this Product can satisfy the appropriate structural, fire, moisture, thermal, acoustic and durability requirements of a Structural Warranty provider. Please contact the relevant Structural Warranty provider to ascertain their project specific design requirements and to confirm their acceptance on a case-by-case basis.

4 SOURCES

- BS EN ISO 4590:2016 Rigid cellular plastics. Determination of the volume percentage of open cells and of closed cells
- BS EN ISO 6946:2017 Building components and building elements. Thermal resistance and thermal transmittance. Calculation methods
- BS EN ISO 10211:2017 Thermal bridges in building construction. Heat flows and surface temperatures. Detailed calculations
- BS EN ISO 10456:2007 Building materials and products. Hygrothermal properties. Tabulated design values and procedures for determining declared and design thermal values
- BS EN ISO 13788:2012 Hygrothermal performance of building components and building elements. Internal surface temperature to avoid critical surface humidity and interstitial condensation. Calculation methods
- BS EN 300:2006 Oriented strand boards (OSB). Definitions, classification and specifications
- BS EN 826:2013 Thermal insulating products for building applications. Determination of compression behaviour
- BS EN 1604:2013 Thermal insulating products for building applications. Determination of dimensional stability under specified temperature and humidity conditions
- BS EN 1607:2013 Thermal insulating products for building applications. Determination of tensile strength perpendicular to faces
- BS EN 1609:2013 Thermal insulating products for building applications. Determination of short term water absorption by partial immersion
- BS EN 12086:2013 Thermal insulating products for building applications. Determination of water vapour transmission properties
- BS EN 12667:2001 Thermal performance of building materials and products. Determination of thermal resistance by means of guarded hot plate and heat flow meter methods. Products of high and medium thermal resistance
- BS EN 13501-1:2018 Fire classification of construction products and building elements. Classification using data from reaction to fire tests
- BS EN 14315-1:2013 Thermal insulating products for buildings. In-situ formed sprayed rigid polyurethane (PUR) and polyisocyanurate (PIR) foam products. Specification for the rigid foam spray system before installation
- BS EN 14315-2:2013 Thermal insulating products for buildings. In-situ formed sprayed rigid polyurethane (PUR) and polyisocyanurate (PIR) foam products. Specification for the installed insulation products
- BS EN 15026:2007 Hygrothermal performance of building components and building elements. Assessment of moisture transfer by numerical simulation
- BS 5250:2021 Management of moisture in buildings. Code of practice
- BS 6093:2006+A1:2013 Design of joints and jointing in building construction. Guide
- BS 8000-0:2014 Workmanship on construction sites. Introduction and general principles
- BS 8104:1992 Code of practice for assessing exposure of walls to wind-driven rain
- American Chemistry Council Spray Foam Coalition:2012 Guidance on best practices for the installation of spray polyurethane foam
- BRE Information Paper 1/06:2006 Assessing the effects of thermal bridging at junctions and around openings
- BRE Report 262:2002 Thermal insulation: avoiding risks
- BRE Report 443:2006 Conventions for U-value calculations
- BRE Report 497:2016 Conventions for calculating linear thermal transmittance and temperature factors
- PAS 2030:2019 Specification for the installation of energy efficiency measures in existing dwellings and insulation in residential park homes
- PAS 2035:2019 Retrofitting dwellings for improved energy efficiency - Specification and guidance
- Regulation (EC) No 1907/2006: Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH)
- The Chemicals (Hazard Information and Packaging for Supply) Regulations 2009

Remark - Apart from these sources, technical information and confidential reports have been assessed; any relevant documents are in the possession of Kiwa Ltd. and are kept in the Technical Assessment File of this Agrément. The Installation Manual for the Product may be subject to change, and the Agrément holder should be contacted for the clarification of revisions.

5 AMENDMENT HISTORY

Revision	Amendment description	Author	Approver	Date
-	First Issue	C Devine	C Vurley	December 2021
A	Issue with NHBC acceptance	C Devine	C Vurley	April 2022
B	Update to Building Regulations	A Chapman	C Devine	May 2023
C	Updates to third-party acceptance	A Chapman	C Devine	November 2024

6 CONDITIONS OF USE

This Agrément may only be reproduced and distributed in its entirety.

Where a National Annex exists in respect of a BS EN (or other) standard, its use is deemed mandatory wherever the original standard is referenced.

Kiwa Ltd. has used due skill, care and attention in the preparation of this BDA Agrément®.

Whilst all due diligence has been used, no liability or warranty is extended by Kiwa Ltd.

The Agrément holder is responsible for advising Kiwa Ltd. immediately if there is a variation to the Product specification or constituent elements/components after initial publication of this BDA Agrément®.

For full terms and conditions, refer to Kiwa Ltd.
